Topic : News Tracker Application

1. Pull an image from docker hub and run it on docker playground

To run a pulled image in docker playground, copy the run command of the pulled image.

[chat](#) [on gitter](#)

```
docker pull uifd/ui-for-docker
```

- Minimal dependencies - I really want to keep this project a pure html/js app.
- Consistency - The web UI should be consistent with the commands found on the docker CLI.

```
1. Run: docker run -d -p 9000:9000 --privileged -v /var/run/docker.sock:/var/run/docker.sock uifd/uifd-for-docker
```

- Blind mounting the Unix socket into the UI For Docker container is much more secure than exposing your docker daemon over TCP. The `--privileged` flag is required for hosts using SELinux. You should still secure your UI For Docker instance behind some type of auth. Directions for using Nginx auth are [here](#).

You can use the `-H` flag to change this socket:

Aboutus

Mission

SMARTBRIDGE is an edTech organization with a vision to bridge the gap between academia & industry. Our outcome-based experiential learning programs on emerging technologies (Internet of Things, Machine Learning, Data Science, Artificial Intelligence, Robotics) are building skilled entry - level engineers, for the corporate world. .

Vission

Our main objective is to bridge the existing gaps between prevailing industry standards and what the academics offer to the graduates while passing out of university. SmartBridge offers suitable skill deployment and training to the young talent before on boarding their first job. Our skill development programs are designed considering the present expectations in the industry.

Objective

Well directed career guidance programs for educational institutions
Appropriate certification courses that suit the industry need
Train the trainers; expanded awareness about the current industry standards
Liaise with corporates to offer niche internships
Establish technology development centers in colleges
Specialised incubation centers in collaboration with corporates

JobPortal

Lorem ipsum dolor sit amet consectetur adipisicing elit. Voluptatum quis, reiciendis id magni magnam, accusamus nobis in, temporibus molestias ab placeat rerum aperiam illum perspiciatis ducimus non! Fugiat, odit ducimus.

3. Create a Kubernetes Cluster in IBM cloud and deploy hello world image or job portal image.

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows [Version 10.0.19042.1706]
(c) Microsoft Corporation. All rights reserved.

C:\Users\EICOT>kubectrl
kubectrl controls the Kubernetes cluster manager.

Find more information at: https://kubernetes.io/docs/reference/kubectrl/

Basic Commands (Beginner):
  create      Create a resource from a file or from stdin
  expose      Take a replication controller, service, deployment or pod and expose it as a new Kubernetes service
  run         Run a particular image on the cluster
  set         Set specific features on objects

Basic Commands (Intermediate):
  explain     Get documentation for a resource
  get         Display one or many resources
  edit        Edit a resource on the server
  delete      Delete resources by file names, stdin, resources and names, or by resources and label selector

Deploy Commands:
  rollout     Manage the rollout of a resource
  scale       Set a new size for a deployment, replica set, or replication controller
  autoscale   Auto-scale a deployment, replica set, stateful set, or replication controller

Cluster Management Commands:
  certificate Modify certificate resources.
  cluster-info Display cluster information
  top         Display resource (CPU/memory) usage
  cordon      Mark node as unschedulable
  uncordon    Mark node as schedulable
  drain       Drain node in preparation for maintenance
  taint       Update the taints on one or more nodes

Troubleshooting and Debugging Commands:
  describe    Show details of a specific resource or group of resources
  logs        Print the logs for a container in a pod
  attach      Attach to a running container
  exec        Execute a command in a container
  port-forward Forward one or more local ports to a pod
  proxy       Run a proxy to the Kubernetes API server
  cp          Copy files and directories to and from containers
  auth        Inspect authorization
  debug       Create debugging sessions for troubleshooting workloads and nodes

Advanced Commands:
```

```
C:\WINDOWS\system32\cmd.exe - docker login
kubect1 [flags] [options]

Use "kubect1 <command> --help" for more information about a given command.
Use "kubect1 options" for a list of global command-line options (applies to all commands).

C:\Users\ELCOT>cd C:\Program Files\job-portal-main\job-portal-main
C:\Program Files\job-portal-main\job-portal-main>kubect1 create -f deployment.yaml
error: the path "deployment.yaml" does not exist
C:\Program Files\job-portal-main\job-portal-main>kubect1 create -f deployment.yaml
error: the path "deployment.yaml" does not exist
C:\Program Files\job-portal-main\job-portal-main>docker login
Authenticating with existing credentials...
Login Succeeded
```

```
C:\WINDOWS\system32\CMD.exe
--template='':
  Template string or path to template file to use when -o=go-template, -o=go-template-file. The template format
  is golang templates [http://golang.org/pkg/text/template/#pkg-overview].

--validate='strict':
  Must be one of: strict (or true), warn, ignore (or false).          "true" or "strict" will use a schema to validate
  the input and fail the request if invalid. It will perform server side validation if ServerSideFieldValidation
  is enabled on the api-server, but will fall back to less reliable client-side validation if not.          "warn" will
  warn about unknown or duplicate fields without blocking the request if server-side field validation is enabled
  on the API server, and behave as "ignore" otherwise.          "false" or "ignore" will not perform any schema
  validation, silently dropping any unknown or duplicate fields.

--windows-line-endings=true:
  Only relevant if --edit=true. Defaults to the line ending native to your platform.

Usage:
  kubect1 create -f FILENAME [options]

Use "kubect1 <command> --help" for more information about a given command.
Use "kubect1 options" for a list of global command-line options (applies to all commands).

C:\Program Files\job-portal-main\job-portal-main>kubect1 create -f service.yaml
error: the path "service.yaml" does not exist
C:\Program Files\job-portal-main\job-portal-main>kubect1 create -f deployment.yaml
deployment.apps/flask-node-deployment created
C:\Program Files\job-portal-main\job-portal-main>
```
